Spring Lake's Shoreline

As a complement to the Rein in the Runoff stormwater project, the Grand Haven Area Community Foundation awarded funding to the Annis Water Resources Institute to identify the locations along the Spring Lake shoreline that still exist in a natural state, those that have been developed (hardened), and those where landowners have allowed natural vegetation to re-emerge. This provides better information about where stormwater runoff is entering Spring Lake, and helps local stakeholders make better decisions about where the placement of stormwater BMPs would do the most good to improve water quality.
